

## Planning for Resilient Communities: Infrastructure Inventory

PVPC is continuing efforts to help communities be ready to withstand the impacts from heavy storms, flooding, extreme heat and other climate-related events with a new program to create an inventory of vulnerable transportation and water infrastructure in the region.

The project will map a host of important public structures, including roads, rail lines, airports, drinking water supplies, sewage treatment plants, and culverts. Input will be sought from municipal officials in which the most vulnerable structures are located, and a series of state-of-the-art recommendations to help the structures better withstand climate-related impacts will be proposed.
